Unit 4 · Session 12 · SLO 2 — Solved Worksheet

Name: DEEP SAND DEEP SAND | **Reg. No:** RA2511026010557

Unit â€“ 4 : Session â€“ 12 : SLO â€“ 2 | Evaluate and Document the Paradigm Usage

I. Description (2â€“3 lines)

• In my project (a task-tracker web app), the entire data-transformation layer is written in the functional paradigm: every update is a pure function that maps the current task list to a new one instead of mutating shared state.

• Filtering completed tasks, sorting by deadline and computing statistics are composed using map(), filter() and reduce() with lambda expressions, so each operation is independently testable.

• Because the functions are side-effect free, the UI simply re-renders from the returned state â€” demonstrating referential transparency and making the code easier to debug and extend.
