Unit 4 · Session 10 · SLO 1 — Solved Worksheet

Name: DEEP SAND DEEP SAND | **Reg. No:** RA2511026010557

Unit â€“ 4 : Session â€“ 10 : SLO â€“ 1 | TCP Sockets in Python

I. Multiple Choice

1. c) Wait for connections â€” listen() puts the server socket into passive mode, queuing incoming connection requests.

II. Fill in the Blanks

1. bind() associates the socket with an IP address and a port number.
2. accept() returns a new socket object for the client connection (plus the client's address).

III. Key Notes

• Typical server sequence: socket() â†’ bind() â†’ listen() â†’ accept() â†’ recv()/send() â†’ close().
• listen(backlog) only configures the queue; the actual handshake completes at accept().
