Unit 4 · Session 6 · SLO 1 — Solved Worksheet

Name: DEEP SAND DEEP SAND | **Reg. No:** RA2511026010557

Unit â€“ 4 : Session â€“ 6 : SLO â€“ 1 | Parallel Computing Paradigms and Key Models

I. Fill in the Blanks

1. Parallel â€” parallel computing allows multiple processes to run simultaneously.
2. Shared â€” shared-memory architecture gives all processors one global memory space.

II. Multiple Choice

1. b) Shared Memory â€” tightly coupled processors communicate through a common address space with low latency, so the shared-memory model suits them best.

III. Key Notes

• Shared memory: tightly coupled, communication via variables in common memory (e.g. multicore CPUs, OpenMP).
• Distributed memory: loosely coupled, each node owns private memory, communication via message passing (e.g. clusters, MPI).
