# Data Structures and Algorithms · 21CSC201J

Unit 2 · Session 1 · SLO 1 — Solved Worksheet

**Name:** DEEP SAND DEEP SAND | **Reg. No:** RA2511026010557

## Unit â€“ 2 : Session â€“ 1 : SLO â€“ 1 | Fundamentals of Arrays and Their Operations

### I. Fill in the Blanks

1. contiguous â€” array elements are stored in contiguous memory locations.
2. 0 â€” the first index is usually 0 (in C).
3. arr[4] â€” the 5th element is at index 4.
4. append â€— adding at the end of a dynamic array.
5. searching â€— finding the position of an element.
6. shifting â€— middle insertion requires shifting elements right.
7. data type â€— arrays are declared as: type name[size];
8. two-dimensional (2D) â€— used to represent matrices.
9. same â€— all elements share one data type.
10. size (capacity/length) â€— how many elements it can hold.
11. single-dimensional (one-dimensional).
12. deletion â€— removing an element from a position.
13. integer (non-negative integer) â€— indices must be integers.
14. fixed â€— size is fixed once declared in C.
15. for â€— the for loop is the common traversal loop.
