I. Fill in the Blanks

1. paradigm â€” a good project should demonstrate a real-world application of a programming paradigm (functional, logic, OOP, parallel or distributed).

2. design â€” final documentation should include design (problem statement, architecture), implementation, and results.

II. Multiple Choice

1. b) Web app using recursion and higher-order functions â€” this genuinely exercises the functional paradigm; the other options rely on mutable global state, side effects or randomness, which functional programming avoids.
