Unit 5 · Session 9 · SLO 2 — Solved Worksheet

Name: DEEP SAND DEEP SAND | **Reg. No:** RA2511026010557

Unit â€“ 5 : Session â€“ 9 : SLO â€“ 2 | Designing Simple Interactive Forms Using Events

I. Questions & Answers

1. Aligning widgets vertically â€” pack them with side="top" (the default): widget.pack(), or use grid() placing each widget in its own row.

2. Reading user input from an Entry â€— call entry.get(), typically inside the submit button's handler: name = entry_name.get().

3. What makes a form "interactive" â€— widgets are bound to event handlers (button commands, key bindings, validation callbacks) so the application reacts immediately to user actions: submitting, validating, enabling/disabling fields and updating output dynamically.

II. Mini Example

• import tkinter as tk
• root = tk.Tk()
• e = tk.Entry(root); e.pack()
• tk.Button(root, text="Submit",
• command=lambda: print("Hello", e.get())).pack()
• root.mainloop()
